

Implementation Update & Access Guide

What was built for each item of client feedback, how it works, and the exact steps to open it in the app. Prepared 19 June 2026.

DONE — works now

REVIEW — needs your sign-off

BUILT — needs a device build to fire

Map & pins

1. Flickering events

DONE

WHAT IT DOES

Event pins on the map no longer flicker while you pan, zoom or as live data refreshes.

HOW IT WORKS / WAS BUILT

Each pin used to redraw itself continuously. Pins now rasterise once, then freeze, and only redraw for a real tap select/deselect. Shadows were also moved off the inner glyph to stop shimmer. (File: *EventPin.tsx*.)

HOW TO ACCESS IT

1. Open the app on the map view.
2. Pan around the London pin cluster and pinch-zoom in and out.
3. The pins stay steady — no flicker. Good to film next to the old recording.

2. Enlarge animation on tap

DONE

WHAT IT DOES

Tapping a pin makes it spring larger; it eases back to normal when you tap away or close the card.

HOW IT WORKS / WAS BUILT

A spring scale (~1.3x) runs on select and reverses on deselect, captured cleanly so the pop reads on screen. (File: *EventMarker.tsx*.)

HOW TO ACCESS IT

1. Tap a single pin slowly — it grows as the detail card opens.
2. Tap Close on the card — the pin shrinks back to normal.
3. Repeat on one or two pins so it reads on camera.

3. Colour coding as an outline

REVIEW

WHAT IT DOES

The loose colour dot is gone. The category colour is now the ring/outline around each pin.

HOW IT WORKS / WAS BUILT

Both pin types are now a coloured-ring bubble — sports show their sport symbol, everything else shows the DriveIQ mark, and the ring colour signals the category. (Files: *EventMarker.tsx*, *eventIcons.ts*.)

HOW TO ACCESS IT

1. Stay zoomed so several pins are visible.
2. Point out the different ring colours: blue sports, purple music, pink theatre, etc.
3. Tap one pin to show the matching colour on the detail card.

This is the item the client asked to SEE before confirming. Film it as: “here’s the outline version you asked for — tell me if you want the ring thicker or thinner.”

8. Big events missing from the API (Ascot / Epsom)

DONE

WHAT IT DOES

Major events that aren’t in the live data feeds now appear on the map. Royal Ascot is on the map this week; Wimbledon is on too. Each shows as a gold pin with a star.

HOW IT WORKS / WAS BUILT

A curated “featured events” layer merges with the live API results. New events are a one-line entry, with verified date, venue and coordinates. (File: *featuredEvents.ts*, wired into *events.ts*.)

HOW TO ACCESS IT

1. Set the date filter at the top to “Today”.
2. Pan/zoom west of London to Ascot — find the gold pin with the star.
3. Tap it to show “Royal Ascot 2026” details.
4. Switch the filter to “All” to also show the Wimbledon featured pin.

Saving, reporting & branding

11. Event saving + add to calendar

BUILT

WHAT IT DOES

Open any event and you can Save it (reminder one hour before it starts) or add it to your phone calendar with the start and end time.

HOW IT WORKS / WAS BUILT

Saving stores the event and schedules the reminder; Calendar writes a device-calendar entry with a 60-minute alarm. (Files: *savedEvents.ts*, *calendar.ts*, buttons in *EventDetailsSheet.tsx*.)

HOW TO ACCESS IT

1. Tap a pin to open the event card.
2. Tap Save — it switches to “Saved”.
3. Tap Calendar — a confirmation popup appears.

The buttons work and can be filmed now. The reminder actually firing and the calendar write need the device build with the native modules (see Build notes).

7. Add / Report feature (brought back)

REVIEW

WHAT IT DOES

Report something on the map — hazard, accident, roadworks, closure, police or event — with an optional note. It drops a coloured pin and clears itself after a while.

HOW IT WORKS / WAS BUILT

A report sheet creates a categorised, time-limited pin stored on the device. (Files: *reports.ts*, *ReportSheet.tsx*, *ReportMarker.tsx*.) Device-local for now; a shared backend is the next step.

HOW TO ACCESS IT

1. Tap the + button on the right-hand button stack (just under the crosshair).
2. Move the map so the centre sits over the spot.
3. Choose a category (e.g. Hazard) and type a short note.
4. Tap Submit report — the coloured pin appears.
5. Tap that pin to see details and a Remove option.

The client wanted to shape this together. Film it as a first version and invite his changes.

4. Top “DrivelQ” + logo and menu branding

DONE

WHAT IT DOES

The logo now sits next to “DrivelQ” at the top of the screen, and the same logo + branding appears in the side-menu header.

HOW IT WORKS / WAS BUILT

Logo badge added to the top pill and the menu header. (Files: *index.tsx* top pill, *SidebarMenu.tsx*.)

HOW TO ACCESS IT

1. Look at the top-left pill: menu icon + logo + “DrivelQ”.
2. Tap it to open the side menu.
3. The logo + “DrivelQ” show in the menu header.

Menu, support & onboarding

5. DrivelQ AI Support

REVIEW

WHAT IT DOES

A chat helper that answers “how do I...” questions about the app, placed directly under “Send feedback” as requested.

HOW IT WORKS / WAS BUILT

On-device assistant with suggested questions; the chat UI is ready to connect to a smarter AI backend later. (File: *AI\SupportSheet.tsx*, row added in *SidebarMenu.tsx*.)

HOW TO ACCESS IT

1. Open the side menu and scroll to the Support section.
2. Tap “DrivelQ AI Support” (directly under Send feedback).
3. Type e.g. “how do I save an event?” and show the answer.
4. Tap one of the suggested-question chips.

9. Help/FAQ, Send feedback, About — copy & layout

DONE

WHAT IT DOES

All built as real screens with written copy: Help & FAQs (9-question accordion), Send feedback (emails support), About DriveIQ, and DriveIQ AI Support.

HOW IT WORKS / WAS BUILT

Four support sheets wired from the menu. (Files: *HelpSheet.tsx*, *FeedbackSheet.tsx*, *AboutSheet.tsx*, *AI\SupportSheet.tsx*.)

HOW TO ACCESS IT

1. Open the side menu → Support section.
2. Tap Help & FAQs and expand a couple of questions.
3. Tap Send feedback to show the form.
4. Tap About DriveIQ to show the page.

6. First-launch onboarding

DONE

WHAT IT DOES

A first-launch walkthrough — 6 cards covering the map, pins, colour key, saving, transport buttons and reporting. The full polished version follows once design is locked and testing is done.

HOW IT WORKS / WAS BUILT

A one-time coachmark tour that records a 'seen' flag so it never re-appears. (Files: *OnboardingTour.tsx*, *onboarding.ts*.)

HOW TO ACCESS IT

1. Delete the app and reinstall (the tour only shows on a fresh install).
2. Launch the app — the first card appears.
3. Tap Next through all 6 cards, then "Let's go".

10. Notifications — do they actually work?

BUILT

WHAT IT DOES

The system watches major road incidents, train/tube line closures, and schedules saved-event reminders.

HOW IT WORKS / WAS BUILT

All the logic is in place and diffs live data each poll, but it only fires once the app is built with the notifications native module — it does nothing in Expo Go. (File: *notifications.ts*.)

HOW TO ACCESS IT

1. Open the side menu → tap Notifications.
2. Show the category toggles and per-line options.
3. On camera, explain delivery gets verified on the next device build.

Don't film this as 'working' yet — show the settings and state it's pending the device-build test, so nothing is over-claimed to the client.

Build notes & what's next

- **Film freely on any build:** points 1, 2, 3, 4, 5, 6, 7, 8, 9 and the Save/Calendar buttons in 11.
- **Needs a device build with native modules to actually fire:** notifications (10) and the reminder + calendar actions (11). To enable: install *expo-notifications* and run *bunx expo install expo-calendar*, reinstall pods, then build.
- **Onboarding (6)** only appears on a fresh install — delete & reinstall to film it.

- **Record on a real device or dev/standalone build** — Expo Go on iOS shows Apple Maps instead of the Google map.
- **Awaiting your sign-off before lock-in:** the pin outline (3), the report flow (7), and DriveIQ AI Support (5).
- **App version** is at 5.0.4 (build 5), ready for a TestFlight build once you approve the above.
